AHOT learning-outcomes report

Building Webpages with Online Shop Functionality

TO00CD61-3002 / 5 credits

Michal Kowalczyk Prepared for Arvind Sharma 19 October 2026

Alongside my work as a project coordinator at a mental health clinic and my Laurea studies, I create websites for therapists and wellness professionals as a hobby and side hustle. My coding knowledge is limited; AI assistance is central to how these projects were built. Please consider this work as evidence of prior learning.

Further evidence is needed: I have not built a WooCommerce or packaged shop, measured marketing that drove Brandit token purchases, demonstrated shop-specific product SEO/results, or analysed live paid-shop conversions. I welcome a supplementary assignment addressing these gaps.

1. **Build an online shop and integrate it with a website**

   Brandit's public website, https://www.branditlondon.com/, presents branding, visibility and operations services and links to the client workspace and a free 30-minute call form. Token bundles are offered inside the practitioner workspace, through Stripe Checkout. Purchase records, payment verification and webhook fulfilment connect payment to a usable invoicing balance. The homepage does not advertise token bundles.

2. **Drive traffic to the online shop**

   Alicia's service/location pages and published articles support organic discovery. Her website is recent, so meaningful SEO performance is not yet established. Alexander's Cloudflare dashboard provides observed traffic for the analysis below.

3. **Optimise SEO for the online shop**

   For Alicia's site, I used AI assistance to add page-specific titles and descriptions, canonical URLs, sitemap, robots rules and practice, practitioner and location structured data. These demonstrate technical SEO implementation on a service website.

4. **Analyse conversions across business models**

   Alexander's Cloudflare Overview reported about 1.67k unique visitors and 21.6k requests for 19 September-19 October 2026. Its IP-based visitor count can include bots and is not verified human sessions. Resend showed four delivered emails for 5-19 October: two introductory-call request notifications and two visitor acknowledgements. That supports two submitted request notifications, not four leads or confirmed bookings. I cannot calculate a conversion rate from these differing periods and denominators. For Brandit, a suitable measure is distinct verified paid sessions divided by distinct created checkout sessions in a dated cohort.

5. **Support the customer's buying process**

   Brandit recommends sufficient tokens, shows prices and balances, and preserves prepared invoices during checkout. Verified payment triggers fulfilment. The service websites help visitors decide to enquire; Alexander's acknowledgement confirms receipt, while the therapist notification supports follow-up.

I kindly ask that my transferable experience be considered. I can provide a dedicated Brandit demo account for live testing.
